

## Notes for hexaphon rev. 6

The new version of the Hexaphon features a nice slide switch, led (and current-limiting resistor). We found that a resistor of about 82k gives a nice (not too bright) shine, feel free however to experiment with the value of this resistor. The resistor in question is marked out below.

Note that there is a small error on the latest PCB, which means you have to solder a wire between the right-most leg of the potentiometer of oscillator 3 and r-limit (please see the green line on the picture below).
